

What is the Silonite WaterJet all about?

According to most medical researchers, tooth decay and bleeding gums are results of very poor cleansing of the teeth and gums.

Common knowledge believes that a good standard brushing could solve the issue.

The Dacotan Co Ltd developed the WaterJet dental wonder as an instrument that accomplishes what is called in medical terms "Oral Irrigation" by spraying a condensed jet of water, which gently massages the gums.

Who recommends the Silonite Water Jet?

In the company's office, there are many letters signed by experts in the dental field which praise the WaterJet and recommended the use on a daily basis.

According to the scientific research the usage of the Silonite WaterJet is highly effective in preventing gum problems (such as retreat of gums and cleaning gum pockets). In addition, experts in Orthodontia recommend the use of the WaterJet during orthodontic treatment (because of build up of food food and bacterias under the braces)

Why using the tooth brush alongside the Silonit WaterJet?

The Silonite WaterJet alongside with the toothbrush is an ideal addition to dental hygiene and prevention of gingivitis (gum disease).The thin spray of water which flows from the Silonite WaterJet reaches areas that the toothbrush does not reach. In addition, the Silonite WaterJet is effective and a much more pleasant replacement than the conventional dental floss, toothpicks or interdental toothbrushes

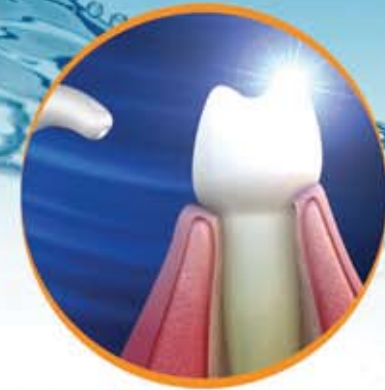

What is Oral Irrigation?

According to recent medical research, oral irrigation improves gums' health .

To be more specific, it cleans the spaces between the teeth and the gums,under the bridges and dental crowns.

It also does the same job on gum pockets. Referring to the above studies, oral irrigation is more beneficial than dental floss and reduces the coat of plaque which builds up on the teeth. The "bacterial plaque" is a sticky layer which is caused by saliva and food remnants building up on the outer layer of the tooth.Food colouring which is commonly found in drinks sticks to the plaque and therefore is the main cause of decays

How does the Silonite WaterJet cure and prevent further dental treatment?

Daily use of the Silonite WaterJet, without any solutions requires only one minute a day. It is one of the safe known solutions to prevent gingivitis and decays.The usage of the toothbrush is necessary but not effective enough to maintain a perfect oral hygiene. This product is only useful as an addition to the regular use of a conventional toothbrush. It is necessary to use both simultaneously. Sometimes, decays are likely to develop unnoticed under a loose filling or dental crown. After a while, the tooth will deteriorate and the use of the Silonite WaterJet will remove the loose filling and delays further decays, thus saving the tooth

Why buy the Silonite WaterJet?

Daily use of the Silonite WaterJet stops retreat of the gums, cure and prevents gingivitis and help to preserve cleanliness of the mouth and without unpleasant odours. The Silonite WaterJet is the ideal complement to the traditional toothbrush. The Silonite WaterJet is a wonderful companion to oral hygiene in both the short and longterm.

Results can be felt within the first two weeks.
